

# Arabian Gazelle

Student ID: [ ]

Institute name: [ ]

## Introduction

The main purpose of this work is to provide the discussion related to the conservation of the Arabic Gazelle. Arabic Gazelle is widely found in the different areas of the Middle East, Asia and Africa, but now they are considered to be the endangered species as they are disappearing because of the different reasons. This work will also provide the suggestions that could play an important role in the conservation of the Arabian Gazelle.

## Discussion

Arabian Gazelle belongs to the genus *Gazella* that is distributed widely across the whole African region, Asia and the Middle East. Arabian Gazelle is found in the areas of Saudi Arabia, Egypt, Jordan, Iran, Israel, Syria, UAE, Yemen and other regions. Before the domestication the different species of Arabic Gazelle were usually hunted. They usually live in the hilly areas, light forests or the deserts. During the last century hunting remained the biggest threat to the Gazelle. Other threats included the changes in the climate, changes in the habitat and the changes brought due to the increased needs of human beings changes in the infrastructure and agriculture.

Arabian Gazelle prefer to live in the territories with solitary males. The groups may become permanent or they are temporary. Gazelles are very good runners. They usually feed on grass, herbs or variety of food. Arabian gazelles have a very good vision, they could smell their predators and could easily detect the presence of their hunters (Hadas, 2).

For the conservation purpose it is needed to take several steps for securing the biodiversity. It is quite challenging to overcome the different problems that are serving to be a big hurdle for the survival of these gazelles. The main challenge is to make the conservation impactful in the future.

However there is an immediate need to implement different conservation programs and ensure the conservation of the Gazelles.

Different training campaigns that will be causing the awareness for the conservation of the gazelles are needed to be designed and implemented. It is also needed to implement these programs in the curriculum of the students. Promoting the different ecotourism activities will also be helpful. Another important step that could be taken might include the development of the habitats that would be ideal for the gazelles and in such a way they could breed in a controlled environment. The government also has the responsibility to take important steps and put a ban on the hunting of Gazelles (Hadas, 5). Different punishments should be given to the hunters. Different social media campaigns could be among the effective ways to increase the awareness and make the people think about their responsibility towards the environment. Collaborating with different international institutions of wild life could also play an important role. There is the need to first focus the reasons that are the threat for their survival and then design a proper strategy.

## Conclusion

The number of Arabian Gazelles are declining day by day and therefore there is the need to take some solid steps to prevent the extinction of the Gazelles. Government, individuals, researchers and the activists all are needed to identify their responsibilities and play important roles.
